

CS543 Assignment 4

Your Name: Hanliang Jiang

Your NetId: hj33

Part 1 Single-View Geometry:

Plot the VPs and the lines used to estimate them on the image plane using the provided code.

Specify the VP pixel coordinates.

```
[ -173.2311828    221.43225806    1.          ]
```

```
[ 1.38116518e+03  2.33930755e+02  1.00000000e+00]
```

```
[ 4.58986113e+02  6.04595451e+03  1.00000000e+00]
```

Plot the ground horizon line and specify its parameters in the form $a * x + b * y + c = 0$. Normalize the parameters so that: $a^2 + b^2 = 1$.

Using the interface, construct the lines on the image that establish that the two gables on the CSL building are the same height. Explain why these lines do so.

Estimating height of front gable
height of front gable is 3.992703724086958 times lamp height
Estimating height of side gable
height of side gable is 3.804148717579115 times lamp height

according to the output result, both the side gable and the front gable are nearly 4 time as tall as the lamp, considering the plotting deviation, we can conclude that the side gable and the front gable are the same height.

Part 2 Fundamental Matrix Estimation, Camera Calibration, Triangulation:

For the lab and library image pairs, display your result (points and epipolar lines) and report your residual for both unnormalized and normalized fundamental matrix estimation.

residual:

```
c2.py  
residual for normalize = True algorithm of library is 0.20481474922140067  
□
```

residual:

```
residual for normalize = False algorithm of library is 0.00895857184218139
```

residual:

```
residual for normalize = True algorithm of lib is 0.33542521351105226
```

residual:

```
residual for normalize = False algorithm of lib is 0.18775086194917967
```

For the lab image pair, show your estimated 3x4 camera projection matrices. Report the residual between the projected and observed 2D points.

```
left camera matrix:
[[-4.53187041e+03 -2.13760331e+02  6.55731767e+02  1.43125880e+06]
 [-4.4880176e+02 -9.31617589e+02  4.05512341e+03  2.98472081e+05]
 [-2.45529487e+00 -4.01727798e+00  1.00000000e+00  1.94283277e+03]]
```

```
right camera matrix:
[[-3.64428424e+03  2.11186971e+03  6.97164388e+02  4.34640617e+05]
 [-8.13701852e+02 -5.38648854e+02  3.82454420e+03  2.95748507e+05]
 [-4.00069964e+00 -1.95030316e+00  1.00000000e+00  1.78129302e+03]]
```

```
left residual: 13.545832895784535
right residual: 15.544953461808563
```

For the lab and library image pairs, visualize 3D camera centers and triangulated 3D points.

```
lab left center coordinate: [305.83276769 304.20103826 30.13699243 1. ]  
lab right center coordinate: [303.10003925 307.18428016 30.42166874 1. ]  
library left center coordinate: [ 7.28863053 -21.52118112 17.73503585 1. ]  
library right center coordinate: [ 6.89405488 -15.39232716 23.41498687 1. ]
```

```
lab residual for left is 11.332279080917273  
lab residual for right is 13.888776951376181  
library residual for left is 51.53227122136155  
library residual for right is 81.28132134985131
```

For the house and gaudi image pairs, display your result and report your number of inliers and average inlier residual for normalized estimation without ground truth matches.

```
MP3_part2_data/gaudi number of inliers: 12  
average residual: 0.008237009073687278  
MP3_part2_data/house number of inliers: 4  
average residual: 7.785502584247676e-21
```

Extra Credit:

In Part 1, I implemented a better way of proving that the gables are the same height, this is a more generalized method which can be used to compare whatever object on the graph.

```
Estimating height of front gable
height of front gable is 3.992703724086958 times lamp height
Estimating height of side gable
height of side gable is 3.804148717579115 times lamp height
```

Besides, I implemented the extra functions which are not required, and I was wondering if it worths some points.
